Eagle Project - St Paul Lutheran Church - Community Garden - Rainwater collection and seed starting area

River Action sells these rainwater barrels with a diverter as shown

At the north garage, we would install 1 barrel and install gutter on the west and south side to catch the water.

We would also paint the window on the south side

At the south garage, we would install two rain barrels on the west side, and gutter on the north and south side to catch the water. We will also paint the window frames on the west side and south side.

Inside the south garage, we would demolish the existing bench and reuse the wood.

We have one prototype of the plant starting area complete. We will need to complete two more, and a workbench from the existing wood recovered. More wood studs will need to be purchased as well. We have 2 bulb surface mounted 2x4 fluorescent light fixtures recovered from demolition work at Geneseo High School. These will need to be wired into a switch at each unit and a timer for the whole system.

We will also be painting the door and frame on the south side of the south garage.
